EXECUTIVE SUMMARY

Altus Group Ltd. is Canadian based analytics, advisory and technology provider to commercial real estate (CRE) business. The firm provides real estate investors, developers, lenders, and public sector clients with data-driven decision-making support to help with valuation, development feasibility, asset management, and portfolio planning by being established in 2005 and headquartered in Toronto.

The intrinsic value of Altus Group was calculated based on pro forma discounted cash flow (DCF) model, consolidated cash flow (CSCF) approach, as well as similar company analysis (CCA), through financial data up to fiscal year 2024.

EBIT under the pro-forma DCF model was projected to increase by a rate of about 6 percent per year which is consistent with historical averages. At a WACC of 7.41% and a growth rate of 2.0 at the terminal, the model provides an intrinsic value of us $21.37 per share, which is significantly lower than the current market value of us $40.25.

A robustness check was performed using a CSCF valuation. Although the absolute valuation is not the same as the pro forma DCF, the CSCF model as well suggests a share value that is significantly lower than the prevailing price in the market, which supports the directional inference that the stock is overvalued.

Sensitivity analysis was done, changing the following key assumptions: discount rate, long-term growth rate, inflation, short-term growth and tax rate, by +-10% of the base-case values. The WACC and terminal growth rate are the most sensitive factors and the effects of changes in inflation and short-term growth of revenue are less sensitive. Industry average tax rate of 20% increases the intrinsic value but still leaves the overall conclusion unchanged.

The DCF results are further supported by a similar analysis of a comparable company based on EV/Revenue, EV/EBITDA and P/E multiples of peer companies; implied share values are usually less than 10 dollars.

Following consistent evidence of the valuation models, the shares of Altus Group are overvalued compared to the fundamentals. The overall investment recommendation is therefore **SELL**.

BUSINESS DESCRIPTION AND OPERATIONS

Altus Group Ltd. is a Canadian multi-national supplier of analytics, advisory and technology projects to the commercial real estate (CRE) market. The company headquartered in Toronto was established in 2005 and has a wide range of clients which includes real estate investors, developers, lenders, asset managers and institutional clients such as the public sector (Figure 2). The fundamental purpose of Altus Group is to facilitate the use of data in making the decisions throughout the real-estate investment cycle: valuation, development viability, asset management, and portfolio planning.

Altus Group has two core business segments which mainly include:

Analytics (Technology Segment)

This division provides application-based software and information solutions that provide customers with the ability to examine house prices, market patterns and investment risk. Some of the products are valuation management systems, market intelligence systems, and portfolio analytics systems. Analytics is a recurring payment subscription-based segment with a high degree of scalability and comparatively constant margins, which forms one of the major growth strategies of the firm in the long-term perspective (Figure 3; Figure 5).

Advisory (Professional Services Segment)

The Advisory segment offers valuation, cost advisory, tax advisory and strategic advisory services. These services are in support of transactions, financial reporting and regulatory compliance. Although this segment is more cyclical and responsive to the volumes of real estate transactions, this segment supplements the Analytics business and increases the reputation of Altus Group as an end-to-end real estate intelligence system.

Altus Group has a geographical presence in North America, Europe, and Asia-Pacific with its biggest markets being Canada and the United States. Due to a diversified exposure to types of property, such as office property, industrial, retail, multifamily, and specialized real estate property, the company enjoys these advantages.

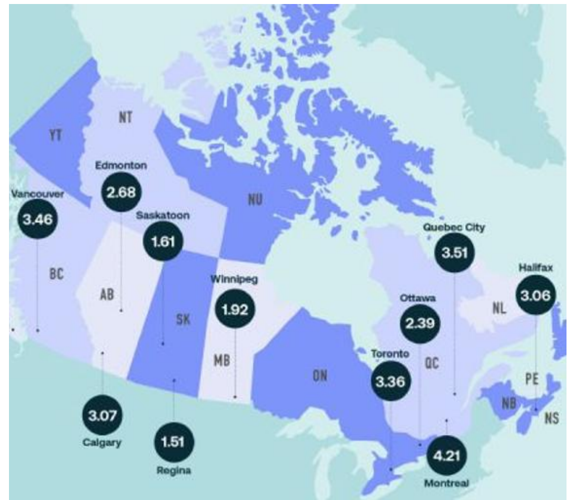
INDUSTRY CONTEXT AND MAJOR TRENDS

Altus group is in the commercial real estate services and analytics business, which is experiencing several structural changes highlighted below:

Greater demand of data and analytics: Institutional investors are demanding more of real-time market intelligence, valuation transparency and risk analytics (Figure 5).

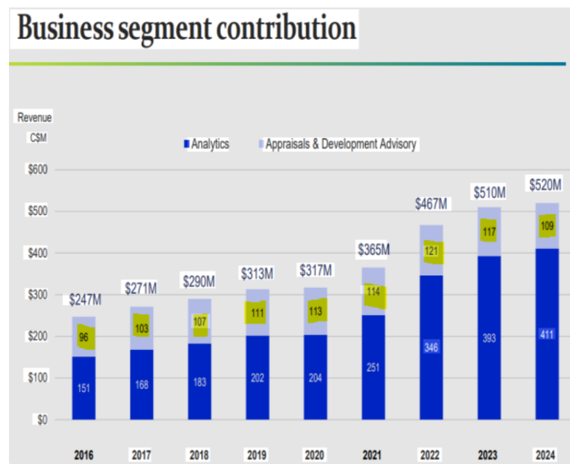
Real estate digital transformation: Older forms of advisory are gradually being augmented or substituted by technology-enhanced platforms.

Figure 2: Altus Group Office Locations



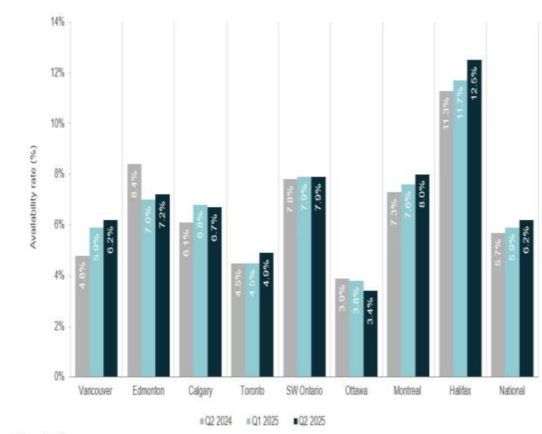
Source: Commercial Property Taxes (2025)

Figure 3: Business Segment



Source: Buy Back Capital (2025)

Figure 4: Availability Rate Per Location



Source: Altus Group (2026)

Cyclicality in transaction activity: The increase in interest rates and macroeconomic uncertainty has cut transaction volumes over the last few years, which impacted on advisory revenues.
Shift towards recurrent revenue models: Companies that have scalable and subscription-based analytics will be in a better position to survive a downturn in the market.
The hybrid model of Altus Group, which integrates the offerings of professional services with technology-driven analytics, which position the company to capitalize on the long-term digitalization trend in the commercial real estate industry, but leave it vulnerable to the short-term cyclicity of the industry.

Porters Five Forces Analysis

Threats of New Entrants - Moderate

While it does not require much capital to start traditional real estate advisory services, it is much challenging to enter analytics-driven platforms.
This is evidenced by:

- Altus Group generate more than CAD 520 million in earnings (2024) by continuing to invest in its own software and information platforms (Figure 11).
- Consistent EBIT margins of about 5-6 % average over the years due to scale economies which hard to be matched by new entrants.
- High fixed costs in the development of software and extensive data cover.

New competitors can locally compete in advisory services, but it would take much time, capital and client adoption, making it effective barriers to entry to reproduce the integrated analytics ecosystem that Altus Group has.

Bargaining Power of Supplier - Low to Moderate

The important suppliers are skilled labor (valuers, analysts, engineers) and data suppliers.

- High percentage of employee compensation which is a similar section of operating expenses as professional services firms.
- However, Altus Group recorded positive EBIT in most years, such as around CAD 9M in 2024 despite headwinds in the market.

Bargaining Power of Buyer - Moderate to High

Buyer power is usually high as clients are usually large institutional investors. The buyer power is however moderated by:

- Analytics revenue distribution.
- Switching costs within proprietary workflows.

The geographic diversification, scale and brand recognition of Altus Group makes it less dependent on individual suppliers, which lowers supplier bargaining power.

Threat of Substitutes - Moderate

Substitutes include:

- In-house valuation teams
- Bread and butter financial modeling
- instruments.

However: The analytics segment of Altus Group provides comprehensive data, benchmarking and reporting to meet the regulatory requirements which cannot be emulated by generic tools.

Competitive Rivalry - High

Competition is very stiff as the players across the world include CBRE and JLL in the industry.

Evidence of rivalry:

- Similar EV/EBITDA multiples are between 9x and more than 14x.
- The EV/EBITDA of Altus Group is lower than the peer median (i.e. 9.3x vs. 12.6x), indicating either underpricing or an increased risk perception.
- Volatility in revenues (e.g. decreasing in 2024) is sensitivity to macroeconomic and transaction cycle.

Swot Analysis

Strengths

- Analytics recurring revenue, which minimizes the fluctuations in earnings.
- Cross-selling is supported by integrated advisory model and technology model.

Weaknesses

- Risk to cyclical commercial real estate activity.
- In the case of low levels of transactions, the advisory margins narrow.

Opportunities

- Analytics platform expansion into new markets and assets.
- The increasing institutional need of data-driven evaluation and risk control.
- Sensitivity in upside: fares reflectively on the lower WACC or the higher assumptions of long-term growth (**Error! Reference source not found.**).

Threats

- Family business history of weak commercial real estate.
- High competition by international advisory companies.
- Potential pricing competition pressure on the margin.

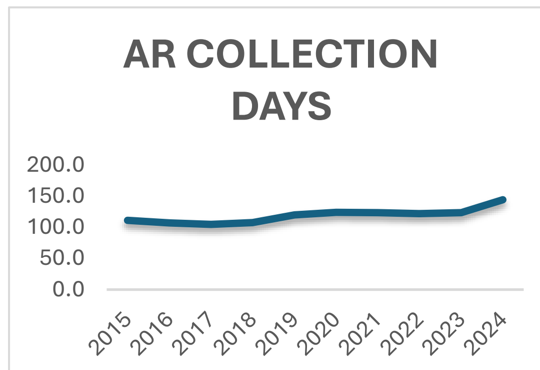
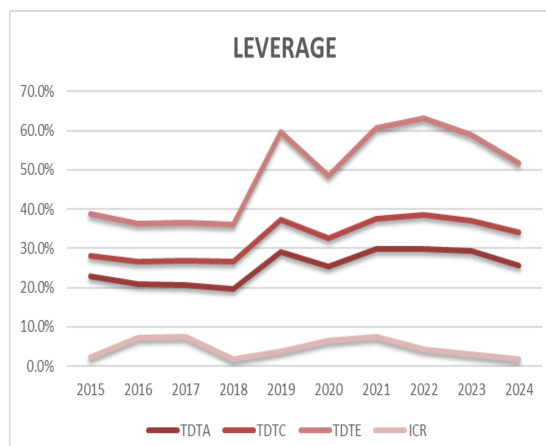
Figure 9: Operating Ratio



Source: Author's Analysis (2026)

Figure 10: Leverage



Source: Author's Analysis (2026)

FINANCIAL HIGHLIGHTS

Profitability – Moderate / Recovering

The profitability of Altus Group has been fluctuating but on the way to recovery during the sample period (2015-2024). The high operating margin (OPM) of 29.7% in 2017 was an exceptionally strong operating performance, but it became negative in 2018 (-2.2%), probably, due to restructuring and pressure on costs. Margins have since been stable but keep at low levels, with OPM standing at 1.7% in 2024 compared with 6.1 the previous year (Figure 7: Profitability Ratio).

The same trend was observed with net profit margin (NPM), which was 23.0 % in 2017, declined to 2.6 % in 2018, and increased slowly to 2.6 % in 2024. The ratio of return on equity went up, as it stood at 2.2% in 2024 compared to 1.7% in 2023, which showed an indication of better shareholder returns even though it was not at the historical levels. These dynamics favour moderate growth in assumptions of EBIT (6 %) in pro forma model than aggressive growth in margin.

Liquidity – Adequate / Increasing

The current ratio decreased in 2019 to the lowest point of 0.87 compared to 1.84 in 2015, indicating short-term balance sheet pressure in the same year. Liquidity has been improving and stabilizing since 2020 and at the current ratio of 1.68 in 2024, it indicates that short term liabilities are adequately covered by short term assets (Figure 8: Liquidity Ratio).

This recovery confirms the fact that Altus will be able to finance its operations and working capital requirements without overburdening short-term financing, just like the moderate changes in net working capital employed in the DCF projections.

Operating Efficiency – Weak / Deteriorating

The operation efficiency in terms of accounts receivable turnover and collection days has worsened over time. Mean days to receivable collection also improved by 111 days to 144 days in 2015 and 2024 respectively, and the receivables turnover improved by 3.30 to 2.54 times accordingly (Figure 9: Operating Ratio).

The increasing collection cycle is an indication of the decreased cash conversion efficiency and warrants a low working capital choice in the valuation. It is also explained by this trend as to why there are years which the growth of the free cash flow is lagging revenue growth.

Leverage and Coverage – Moderate / Increasing

The leverage was growing in a significant way since 2018. The total debt to equity (TDTE) and total debt to total assets (TDTA) increased to 51.8 and 25.6 %, respectively, in 2024 compared to 36.1 in 2018. Despite these increases in leverage, interest coverage (ICR) is above 1, with a 1.79x in 2024, which means that operating income has the capacity to operate to pay the interest, but with a thin margin (Figure 10: Leverage).

The following leverage dynamics justify the chosen WACC of 7.41, indicating moderate financial risk and no distress level leverage.

VALUATION

Methodology Overview

The valuation of the Altus Group was primarily conducted using pro-forma discounted cash flow (DCF) and consolidated cash flow (CSCF) methods to ensure robustness across approaches. These two models use conservative assumptions on growth, margins as well as terminal value, which are consistent with the maturity of the firm and the current market conditions in the Canadian real estate services market. In complement of the two DCF models, CCA was also used to determine the fair share price of Altus Group Ltd.

Valuation Assumptions and Justification

Revenue Growth

Pro-forma method based on historical performance of 2015-2024 was applied in building revenue forecasts (Figure 11: Revenue Trends). Average growth showed 8.1%, and the growth was volatile, with a decline of -32.8% in 2024 signifying cyclical frailty in commercial real estate life. To prevent extrapolation of short-term volatility, short-term revenue growth was phased down to a range between 5.3 % in 2025 to 3.3 % in 2029 when it would stabilize around the long-term growth rate in line with the fundamentals of the Canadian economy. The strategy strikes a balance between the recent performance and macroeconomic realism and does not overstate the momentum of recovery.

EBIT Margin

A stable margin-based approach was used to forecast EBIT, as opposed to absolute growth of EBIT. Historically, the EBIT margins varied considerably as they were ranging between negative (2018) -2.2 and 7.9 (2020) with a historical mean and median EBIT margin of about 5.2% and 6.3% respectively (Figure 12: EBIT Trends).

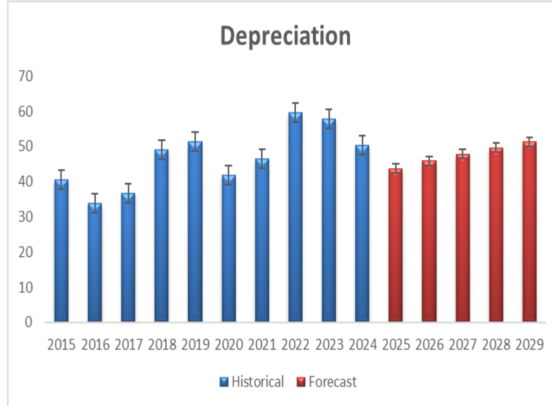
A 6 % EBIT margin was therefore used throughout the forecast period. It assumes of normalized operating efficiency and helps to offset the distortions incurred by one-off items and cyclical moves in historical operating income.

Tax Rate

The effective tax rate applied was 25 % in the base-case valuation, which align with the corporate tax environment in Canada and the normal tax burden of the firm. Although historical implied tax rates ranged widely because of losses and non-recurring items, the 25 % assumption offers a conservative basis to value in the future (Figure 13: Tax).

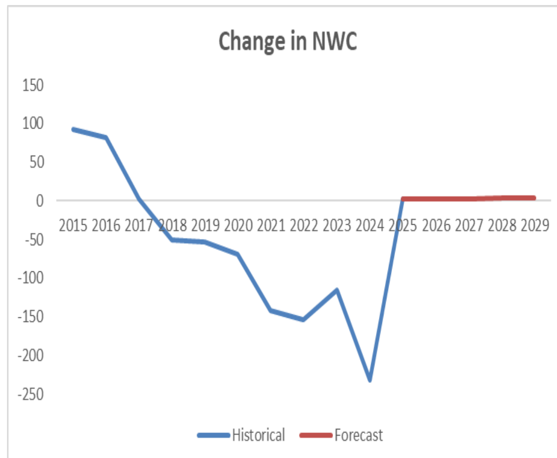
Following the assignment guidelines, a different scenario with the industry average tax rate of about 20 % (obtained in the data on Real Estate Services by Aswath Damodaran) was considered. This situation separates the sensitivity of valuation results to tax assumptions and makes it consistent with industry-level benchmarks.

Figure 14: Depreciation & Amortization



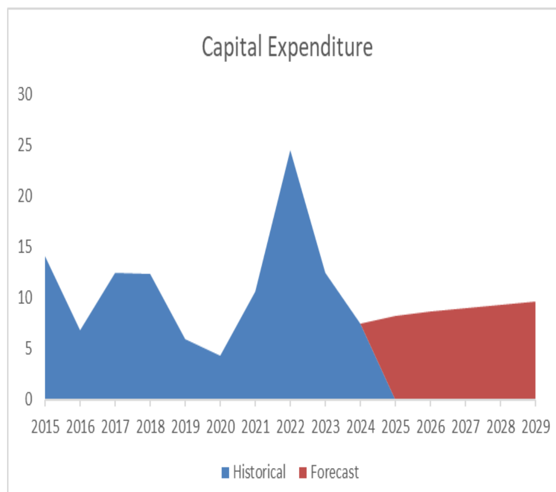
Source: Author's Analysis (2026)

Figure 15: Change in NWC



Source: Author's Analysis (2026)

Figure 16: Capital Expenditure



Source: Author's Analysis (2026)

Depreciation and Amortization

Depreciation and amortization were estimated to be at 8% based on historical average that was around 8-8.5%. Historically, D&A was stable in terms of revenue relative to the changes in capital spending and this can be seen as an indication of the asset-light service-driven business model of the firm (Figure 14: Depreciation & Amortization). Capital expenditures were not directly linked to depreciation so as not to create artificial volatility in projected free cash flows.

Capital Expenditures

Capital expenditures had been projected to be 1.5-2.0% of revenue which is in line with the history of the firm, and it is a sign of maintenance level capital expenditure and not a sign of aggressive expansion (Figure 16: Capital Expenditure). During various historical stages, the capital expenditures were less than the depreciation, which is in line with the notion of a mature firm keeping its assets base intact as opposed to increasing it.

Net Working Capital

Changes in net working capital over time have been rather volatile and most of the time negative which can be attributed to the contract-based revenue model and deferred revenue dynamics of this firm. Since these timing effects are unlikely to recur, future investment in working capital is modelled as 0.5% of revenue, which is a conservative and normalised assumption that is in line with an asset-light business in professional services (Figure 15: Change in NWC).

Discount Growth and Terminal Growth

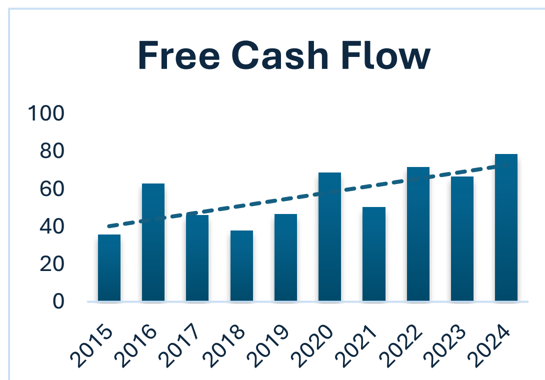
The WACC was estimated at 7.41%, which was based on both industry-level input and capital structure assumed in the database provided by Damodaran (Table 1: Input & Assumptions (CSCF DCF)). The terminal growth rate was set at 2.0%, which was consistent with the long-term growth rate of Canadian GDP and inflation. These parameters make the terminal value economically sustainable and conservative.

Table 1: Input & Assumptions (CSCF DCF)

Current Market Price	$40.25
# of share outstanding	40.40
Long term growth	2.0%
Discount rate (WACC)	7.41%
Inflation	2.50%
Short-term rate	5.31%
Industry Tax Rate	20.00%
Effective Tax Rate	25.00%

Source: Author's Analysis (2026)

Figure 17: Historical Cash Flow



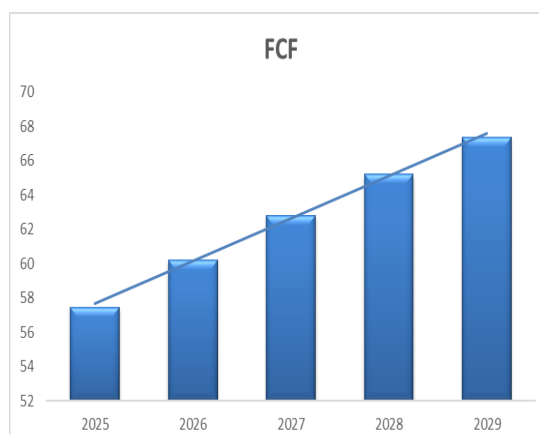
Source: Author's Analysis (2026)

Model Results

Pro-forma DCF

Under the **pro forma DCF framework**, free cash flows were projected over a five-year horizon and discounted at a weighted average cost of capital of **7.41%**, with a terminal growth rate of **2.0%**, aligned with long-run Canadian GDP growth and inflation expectations. This approach yields an estimated enterprise value of **$1.14 billion**, translating into an equity value of roughly **$863 million** after adjusting for net debt (Table 2: Fair Share Price (Pro-forma DCF)). On a per-share basis, the implied intrinsic value is **$21.37**, which is materially below the prevailing market price of **$40.25**. The valuation reflects moderate revenue growth, stable EBIT margins, and a terminal value that accounts for a substantial share of enterprise value, a typical characteristic of mature professional services firms with steady long-term cash flow generation.

Figure 18: Pro-forma (Projected FCF)



Source: Author's Analysis (2026)

CSCF DCF

Complementing the pro forma analysis, a CSCF valuation was conducted where projections were made based on historically consolidated free cash flows. Using the same discount rate and terminal growth assumptions, the CSCF method gives a greater value of the intrinsic value which is about **$35.18 per share** (Table 3: Fair Share Price (CSCF)). This figure is much closer to the market price though it is still lower than the current trading levels. The difference in the CSCF and pro forma results are due to the methodological variations with the CSCF approach giving more emphasis on the historically good cash flow realization whereas the pro forma model uses more conservative assumptions of operating forwardly. Notably, even though both valuation methods have numerical differences, their directional implications indicate a unified view on the topic of relative overvaluation.

Comparable Company Analysis (CCA)

Comparable company analysis was performed with EV/Revenue, EV/EBITDA, and P/E multiples of some of the chosen real estate services peers. The peer group has a median multiple of 1.22x EV/Revenue, 12.58x EV/EBITDA, and 19.91x P/E (Table 4: CCA Results).

Using these median multiples on financials of Altus Group results in implicit share prices of about **$8.82 (EV/Revenue), $9.61 (EV/EBITDA)** and **$5.77 (P/E).** All the implied values are well below the present market price of 40.25, which implies a 75 plus valuation gap on a relative basis.

The low P/E multiple of Altus Group (17.7x) compared to the peer median is not the undervaluation as the earnings would be scaled into equity value. The current operating performance is not justified by the current market as showed by the EV/Revenue multiple of 2.16x, which is higher than the median of the peers (Table 4: CCA Results).

The comparative company analysis repeatedly indicates that Altus Group is overpriced in comparison to the peers using all the valuation measures.

Sensitivity Analysis

Sensitivity analysis was done according to the assignment requirements to examine stability of valuation results in case of different assumptions. The most important inputs, which were varied by +-10% of base-case values, were the discount rate, the terminal growth rate, inflation, the percentage growth of short-term revenues, and the tax rate. The findings show that the discount rate and the terminal growth rate have the greatest sensitivities on the valuation. The implied fair value rises by 10% to the mid-20s with a 10% reduction in the WACC and shrinks intrinsic value by 10% to the high teen with a 10% rise in the discount rate. The sensitivity of short-term growth in revenue and inflation has relatively smaller effects of valuation, which implies that short-term macro assumptions are not critical compared to long run capital cost and growth assumptions (Table 6: Sensitivity Analysis (Pro-forma DCF)).

Table 2: Fair Share Price (Pro-forma DCF)

Enterprise Value	$1,141
Firm Cash	$42
Firm Debt	$320
Equity Value	$863
Fair Share Price	$21.37

Table 3: Fair Share Price (CSCF)

Enterprise Value	$1,699
Firm Cash	$42
Firm Debt	$320
Equity Value	$1,421
Fair Share Price	$35.18

Source: Author's Analysis (2026)

Table 4: CCA Results

Implied by	TEV/Rev	TEV/EBITDA
Enterprise Value	634	666
Firm Cash	42	42
Firm Debt	320	320
Equity Value	356	388
Fair Share Price	8.82	9.61

Source: Author's Analysis (2026)

Moreover, a second scenario with the industry-average tax rate of 20, obtained by Aswath Damodaran in his database, was considered as an alternative to the 25% tax advantage applied at the firm in the base case. This change leads to a slight positive adjustment in the intrinsic value where fair value estimations have been pegged at the low-20s. Nevertheless, the change leaves the overall valuation conclusion unchanged materially, which supports the strength of the base-case results.

Investment Recommendation

The findings generally suggest that the pro forma DCF, CSCF, CCA valuation, and sensitivity analysis evident that the current market valuation by Altus Group incorporates optimistic assumptions that are difficult to substantiate based on conservative and economically sustainable forecasts. Even though the company enjoys robust positioning in real estate analytics and advisory services, industry headwinds and mediocre growth opportunities limit the potential of growth.

Based on the outputs of these valuation models and the sensitivity analyses of these models, the share price is overvalued as per its true cash flow potential. As a result, the overall investment recommendation is **SELL.**

INVESTMENT RISKS

Market and Macroeconomic Risk

Altus Group is a company that is involved in the commercial real estate services sector, which is extremely macroeconomically sensitive. High interest rates and untamed inflation make financing expensive, decrease the transaction volumes, and slow down the process of real estate development (Figure 6: Interest Rate Hike). These are risks that are captured by the valuation outcomes, where a sensitivity analysis reveals that the change in the discount rate of +-10% will cause significant changes in intrinsic value, which implies that it is heavily sensitive to capital market condition changes.

Operating Risk and Profitability Risk

The past performance of the firm in terms of operating performance has been fluctuating with the EBIT having high and low margins through the years of sample period that includes years of low or negative profitability (Figure 20: Operating Risk). Although the base-case valuation presupposes the stabilized EBIT margin and average growth, the pressure of maintaining the margin or lower than anticipated revenue growth will decrease the cash flow formation. The sensitivity analysis reveals that this risk is observable as alterations in assumptions of the short-term revenue growth result in apparent downturns in fair value.

Table 5: Sensitivity Analysis (CSCF DCF)

$ 35.18	5.50%	6.00%	**7.41%**	8.00%	8.50%	9.00%

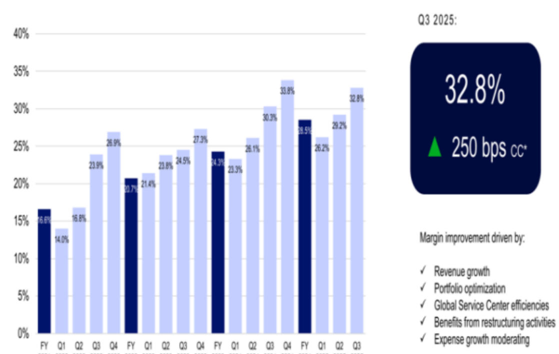
Figure 20: Operating Risk



Source: Altus Group (2025)

Valuation and Model Risk

DCF values are based on large assumptions of the terminal values where the long-term growth and discount rate factors have a prevailing role in determining the intrinsic values. The sensitivity analysis establishes that terminal growth and the WACC are the most sensitive to valuation implying that a slight change in long-run assumption can have significant effects on the estimated share price (Table 6: Sensitivity Analysis (Pro-forma DCF)). This reliance augments model risk especially in an environment of economic uncertainty.

Figure 21: Taxation Policy Risk

Source: Flatland Real Estate (2024)

Industry and Regulatory Risk

Altus Group being a Canadian real estate services firm is subject to the fluctuations in the regulations of property markets, taxation policies as well as development activity (Figure 21: Taxation Policy Risk). The industry-tax-rate sensitivity situation shows that the intrinsic value is lowered by utilizing an industry average tax rate (20) rather than the one unique to a firm, which also indicates that the industry is sensitive to the regulatory and fiscal environment.
